

Contents

Initialization

netinit.sdw Overview of the networking initialization mechanism.
ipinit.sdw Initialization of IP. This section includes binding to the device layer, the socket /AF_INET layer and creation of the route cache, routing table structure, and peer data. (Complete)

IP layer transmission

ipsend.sdw The *ip_build_xmit()* front end to the NF_IP_LOCAL_OUT_HOOK. (Complete)
netfilter.sdw The netfilter interface and its use in output packet handling.

Low level reception

ethrecv.sdw Buffer allocation and packet type determination
devrecv.sdw Input queuing and delivery to the network layer

IP layer reception

iprcv1.sdw Header validation and input routing.
iprcv2.sdw Reassembly of fragmented packets.
iprcv3.sdw Deliver to the transport protocol.

Routing details

routeout.sdw Route cache and FIB routing of IP output packets. (Complete)
routein.sdw Routing of input packets (Complete).

UDP send

udpsock.sdw UDP socket creation (Complete)
udpbind.sdw UDP bind and connect operations (Complete)
udpsend.sdw UDP support for the *sendto()* API. (Complete)

UDP receive

udpdeliver.sdw Fragments of UDP receive delivery code. (*Incomplete*)

Utilities

checksum.sdw Fragments of checksum code. (Incomplete)
skbuff2.sdw Figure illustrating *sk_buff* linkages.
skbuff.sdw Routines for *sk_buff* handling.
sock.sdw Fragments of sock handling code (Incomplete).
